

## IN THE CLAIMS

Claim 1 (original): An irrigated razor assembly, comprising in combination:  
a generally cylindrical hollow razor defined by a tubular handle communicating at one end thereof with the interior of a transverse head structure, said head structure including an exit slot provided with one or more blades, said handle including a plurality of surface folds deployed eccentrically adjacent said exit slot for effecting flexing deformation of said handle in response to pressure pulses within the interior of said handle; and  
water conveying means connected to the other end of said handle for conveying water at pulsating pressure thereto.

Claim 2 (Currently amended): ~~Apparatus~~ The razor assembly according to Claim 1, wherein:  
said folds are conformed as adjacently spaced accordion shaped surface deformation in the wall surface of said handle.

Claim 3 (currently amended): ~~Apparatus~~ The razor assembly according to Claim 2, wherein:  
said conveying means includes a diverter valve connected to a shower water source and to a pressure pulsating shower head.

//

//

//

Claim 4 (Currently amended) ~~Apparatus~~ The razor assembly according to Claim 2,  
wherein:

said conveying means further includes pressure modulating means for producing said  
pulses in the course of conveying said water to said handle.

Claim 5 (Currently amended) ~~Apparatus~~ The razor assembly according to Claim 3,  
wherein:

said diverter valve includes adjustment means for controlling the division of the water  
flow between said conveying means and said pulsating shower head.

Claim 6 (Original) An irrigated razor assembly conformed for attachment to the  
water outlet for a shower head, comprising in combination:

a cylindrical hollow razor defined by a generally tubular resilient handle terminating at one  
end thereof with the interior of a transverse head structure provided an exit slot  
supporting therein one or more blades, said handle including a plurality of surface  
folds deployed eccentrically subjacent said exit slot for effecting flexing  
deformation of said handle in response to pressure pulses within the interior  
thereof;

a flexible water conveyance connected between the other end of said handle and a shower  
water outlet; and

means for producing pulsating water pressure within said conveyance and said handle  
connected thereto.

//

Claim 7 (Currently amended): ~~Apparatus~~ The razor assembly according to Claim 6, wherein:  
said means includes a diverter valve connected to a shower water source and to a pressure pulsating shower head.

Claim 8 (Currently amended): ~~Apparatus~~ The razor assembly according to Claim 6, wherein:  
said conveying means further includes pressure modulating means for producing said pulses in the course of conveying said water to said handle.

Claim 9 (Currently amended): ~~Apparatus~~ The razor assembly according to Claim 7, wherein:  
said diverter valve includes adjustment means for controlling the division of the water flow between said conveying means and said pulsating shower head.
